Management of severe atrophy of the maxilla.

by means of non-regenerative techniques.

Abstract

For the rehabilitation of posterior superior free-end saddles, the author proposes the utilization of pterygoid implants as an alternative to sinus lift procedures.

These implants utilize the anchorage provided by the pterygoid plates and their respective points of resistance.

The surgical technique is described and will include the option of guided surgery (the 3D Pterygoid Implant).

As an alternative to inlay/onlay regenerative techniques, a new surgical protocol involving subperiosteal implants (Eagle Grid) will be proposed.

The author will re-introduce this protocol, revisited, corrected and adapted according to the anatomy and physiology of the maxilla and to the recent technological advances which, in fact, make this protocol extremely effective and innovative.

Objectives

Detailed anatomy and physiology of the maxilla; proposing a new addition to implant rehabilitation literature avoiding the utilization of regenerative techniques.

This course is aimed at
Implantologists, referring dentists and practice managers.

Mauro Cerea

Born in Bergamo, Italy in 1963.

- Graduated in Medicine and Surgery with honours in 1988.
- Principal Director in Maxillofacial Surgery of the Joint hospitals of Bergamo.
- Winner of the university of Milan Prize in Maxillo Facial Surgery Speciality 1994.
- Director of Dentistry and Maxillo Facial surgery at the San Carlo di Paderno Dugnano Clinic in Milan from 1996 to 2006.
- Placing most popular implant brands since 1990.
- Opinion leader for same since 1999.
- Opinion leader for BTK implants since 2009.
